

Review Conditions

Explanation	Screenshot
1. Choose the Conditions Worklist tile from the Profiles and Settings group.	
2. Choose the value list for the Condition Type field to access the list of all existing condition types.	
3. The list includes 74 condition types and their respective application areas. The TCM_Rate condition type is used to determine a rate table for charge calculation. Choose TCM_Rate to proceed.	

Explanation	Screenshot
4. Choose the condition <i>S4TM1_HAND_RATE_DET</i> to proceed.	
i The origin of condition F indicates that this type of condition uses a BRFplus (Business Rule Framework plus) decision table. The grey columns in the decision table represent the decision criteria, which, in this case, is the destination location. The green columns represent the decision results, specifically the rate table. This means that this condition is utilized to determine which rate table should be used for charge calculations based on the transport's destination location.	

Explanation	Screenshot
Choose <i>Next</i> to continue.	
5. The decision criteria in the decision table are based on data access definitions that inform the system on how to retrieve these criteria. Choose <i>Data Access Definition</i> to proceed.	
 In the data access definition, you specify the values that the system should use as inputs for a decision table and the sources from which this data will be retrieved. In this case, the data access definition identifies the destination location for the data. This concludes the simulation.
